

The Nervous System

- ➤ The nervous system is very important in helping to maintain the homeostasis (balance) of the human body.
- ➤ A series of sensory receptors work with the nervous system to provide information about changes in both the internal and external environments.
- ➤ The human nervous system is a complex of interconnected systems in which larger systems are comprised of smaller subsystems each of which have specific structures with specific functions.

Structure and function

Neurons (nerve cells) are the basic elements of the nervous

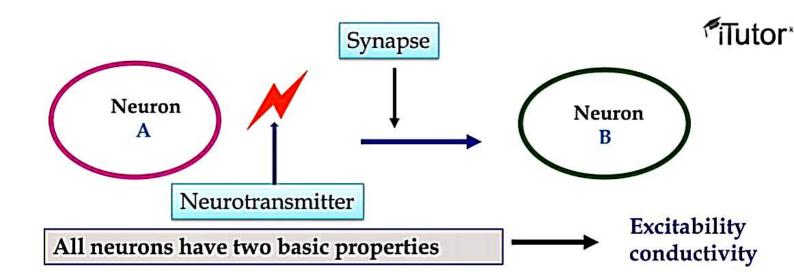

Neurons

- ➤ Cell Body
 - > The main processing center of the cell.
- > Dendrites
 - ➤ Thin branching extensions of the cell body that conduct nerve impulses *toward* the cell body.
- > Axon
 - ➤ A single branch (in most neurons) which conducts nerve impulses away from the cell body.
 - ➤ Myelin sheath and neurilemma are coverings.

Neurons

- ➤ Impulse Transmission
 - ➤ Terminal end fibers are located at the ends of the axon and they transmit impulses leaving the neuron across a synapse to the next neuron.

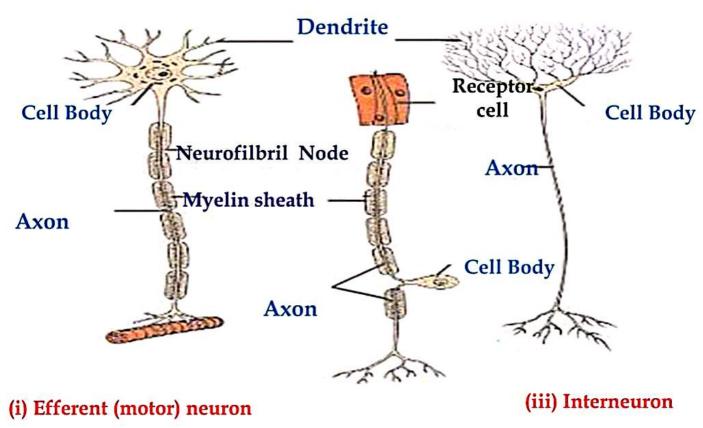

Three Types of Neurons

- ➤ Efferent (motor)
 - > Conveys information from the CNS to muscles and glands.
- ➤ Afferent (sensory)
 - ➤ Carry information from sensory receptors to the CNS.
- > Interneuron
 - ➤ Carry and process sensory information.

Types of Neurons

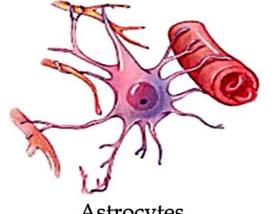

(ii) Afferent (sensory) neuron

Neuroglia

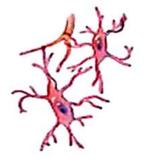

- ➤ Support, protect, connect and remove debris from the nervous system
- ➤ Types of Neuroglial Cells

Astrocytes

Oligodendroglia

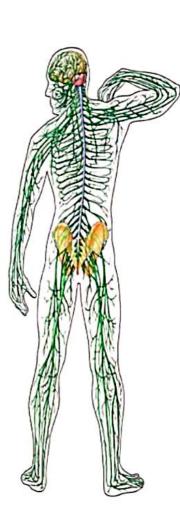

Microglia

Nervous System

- ➤ All bodily activities, voluntary and involuntary, are controlled by the nervous system.
- > Two Major Components
 - Central Nervous System (CNS)
 - Made up of the brain and spinal cord
 - Peripheral Nervous System (PNS)
 - Made up of all the nerves that lead into and out of the CNS.

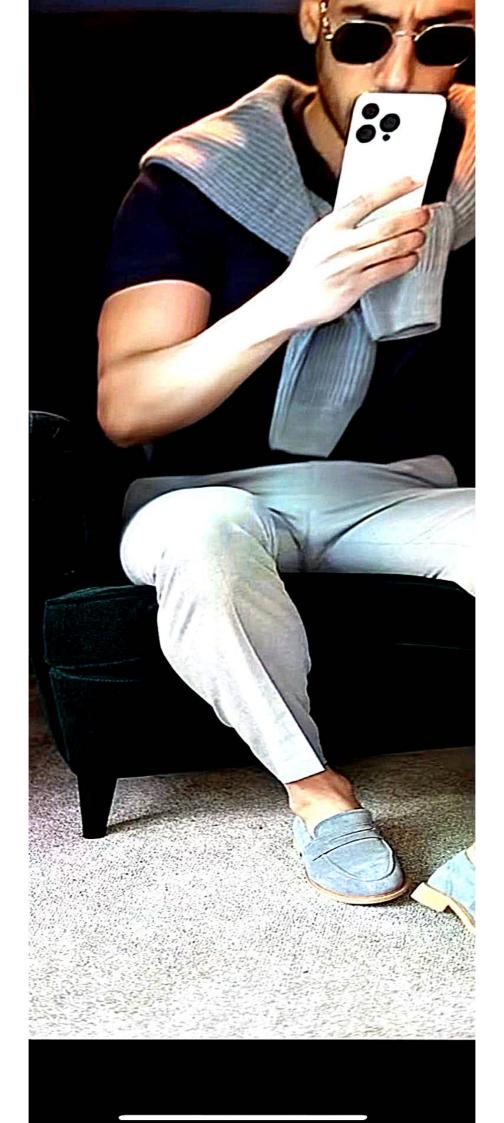

riTutor*

Central Nervous System

- ➤ The central nervous system is composed of two major interconnected organs:
 - The brain
 - The spinal cord.
- ➤ These organs work together to integrate and coordinate sensory and motor information for the purpose of controlling the various tissues, organs, and organ systems of the body.
- ➤ The central nervous system is responsible for higher neural functions, such as memory, learning, and emotion.

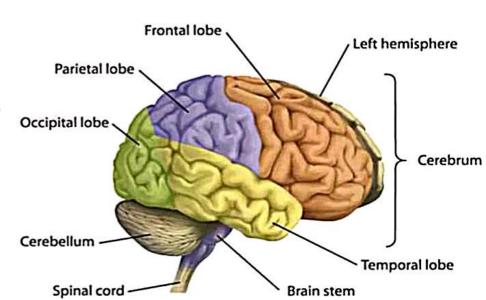

Brain

- ➤ Weighs about 3 pounds in adults
- > 75% water
- ≥ 20% of oxygen
- > Contains over 100 billion neurons
- > Controls bodily functions and interactions with the outside world

- ☐ Cerebrum
- ☐ Diencephalons
- ☐ Brain stem
- ☐ Cerebellum

√iTutor^{*}

- The brain is contained in skull & weighs 1300 1400 g
- made up of about 1000 billion neurons 7 each neuron is surrounded by about 10 glial cells (neuroglia).
- Neurons cannot multiply & many neurons are lost everyday in life but glial cells can multiply throughout the life.
- Brain is also covered by "Meninges" like spinal cord---outer duramater, middle arachnoidmater & inner piamater

Brainstem

Cerebellum

➤ Made up of the midbrain; Pons and the medulla oblongata. Midbrain: Involved with visual reflexes

Pons:

- · Located between the midbrain and the medulla oblongata
- Controls certain respiratory functions

Medulla Oblongata:

 Contains centers that regulate heart and lung functioning, swallowing, coughing, vomiting and sneezing

Cerebellum

Area that coordinates musculoskeletal movement to maintain posture, balance, and muscle tone.

➤Inferior to the occipital lobes of the cerebrum.

➤ Posterior to the pons and medulla oblongata .

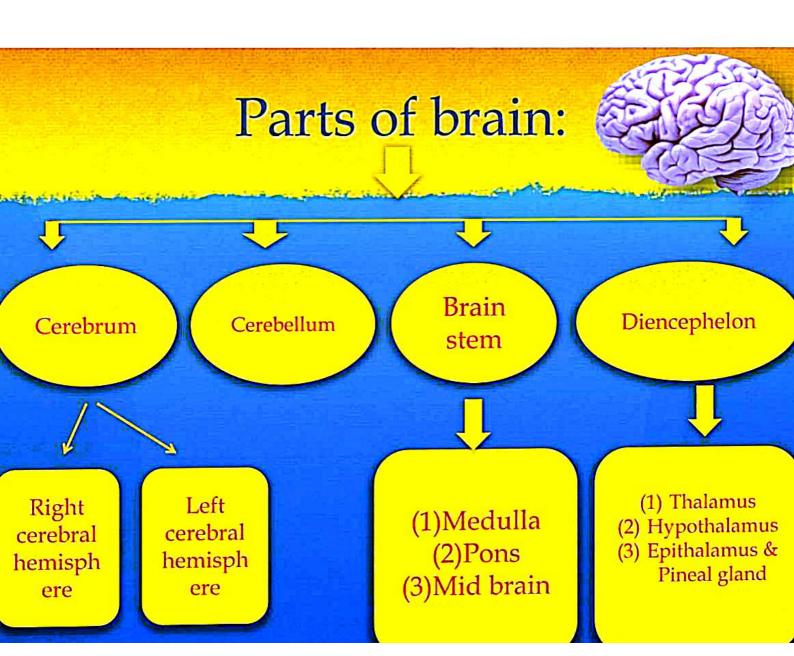

Cerebrum

- > Located above the cerebellum.
- ➤ Contains two hemispheres with an outer portion called the cerebral cortex.
- ➤ The two hemispheres are connected by a bridge of nerve fibers that relay information between the two hemispheres called the corpus callosum.
- ➤ The left and right lobes are each divided into four lobes or parts parietal lobe
 - Frontal lobe
 - Temporal lobe
 - Occipital lobe

Diencephalon: The deep portion of the brain containing:

- Thalamus
- Hypothalamus
- Epithalamus
- Ventral thalamus © iTutor. 2000-2013. All Rights Reserved

- There are certain cavities in the brain called as "ventricles":
- These ventricles are filled with CSF.
- There are 4 ventricles of brain

2 lateral ventricles in two hemisphere of the brain

4th between brain stem & cerebellum

& is continuous with the central cavity of spinal cord 3rd lies between hypothalamus & thalamus

Functions of cerebrum:

- (1) Motor functions like control of voluntary movements.
- (2) sensory functions like perception of pain, temparature, touch, hearing, taste, & smell.
- (3) control of intelligence, speech, memory & learning etc.

(B)Cerebellum

- Second largest portion of the brain
- Located beneath the posterior part of the cerebrum
- A deep groove known as "transverse fissure" separates cerebrum to cerebellum.
- Aids in coordinating voluntary body movements and maintaining balance and equilibrium

Functions of cerebellum:

- (1) Coordinate contractions of skeletal muscles
- (2) Regulate posture & balance
- (3) May play a role in cognition/learning from experieces & language processing

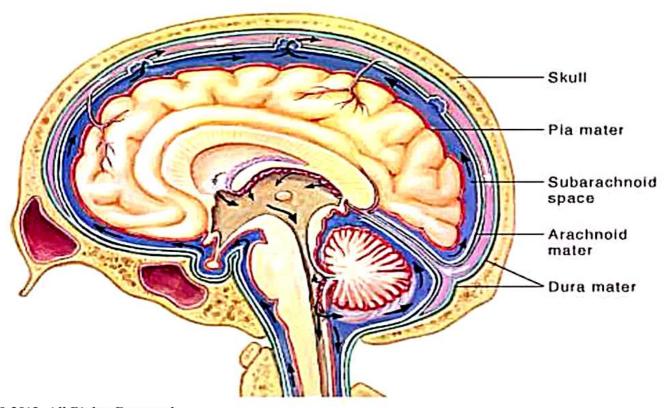

Functions of mid brain:

- The midbrain serves important functions in motor movement, particularly movements of the eye, and in auditory and visual processing.
- Dopamine produced in the substantia nigra and ventral tegmental area plays a role in excitation, motivation.
- The midbrain helps to relay information for vision and hearing.

Serves as relay center for sensations like:

- ➤ Heart rate
- ➤ Blood pressure
- ➤ Temperature control
- ➤ Behavioral responses
- ➤ Digestive functions
- ➤ Water and electrolyte balance

Spinal Cord

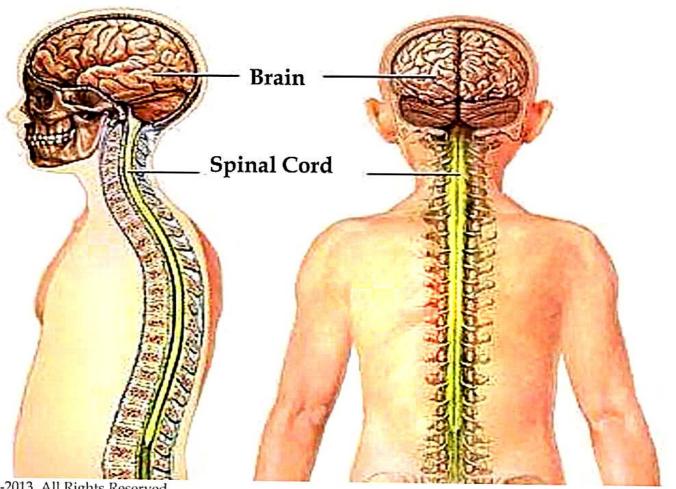

- Extends from the medulla oblongata of the brain to the area around the first lumbar vertebra in the lower back.
- ➤ Nerves from the peripheral nervous system extend out from the spinal cord.
- ➤ Protected by:
 - Vertebral column
- Cerebrospinal fluid
- Meninges
- ➤ Meninges are three layers of membranes that cover the brain and spinal cord.

Layers of the meninges

- ➤ Dura mater
 - ➤ Outer tough fibrous membrane.
- ➤ Arachnoid mater
 - ➤ Middle weblike membrane containing CSF.
- ➤ Pia mater
 - ➤ Innermost layer containing several blood vessels.

"iTutor

Central Nervous System

Peripheral Nervous System

- ➤ The peripheral nervous system (PNS) is a collection of **peripheral nerves**, **ganglia** and specialized sensory structures that, as a system, carries sensory and motor information between the central nervous system and all other organs and tissues of the body.
- ➤ The peripheral nervous system is functionally divided into two major divisions:
 - The Sensory or Afferent Division

The Motor or Efferent Division

The Somatic Nervous System

• The Autonomic (Visceral) Nervous System.

-Spinal Cord

Peripheral nerves

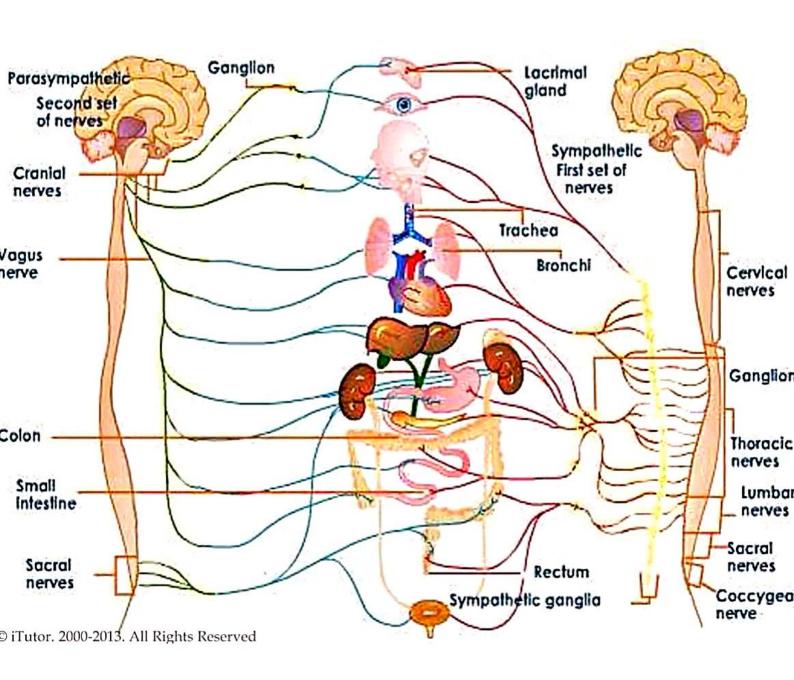

fiTutor*

Peripheral Nervous System

➤ Consists of 12 pairs of cranial nerves and 31 pairs of spinal nerves

| S. No | Cranial Nerves | Function |
|----------|----------------|---|
| 1 | Olfactory | Sense of smell |
| 2 | Optic | Sense of vision |
| 3 | Oculomotor | Eye movements |
| 4 | Trochlear | Aids muscles that move the eyes |
| 5 | Trigeminal | Eyes, tear glands,scalp, forehead, teeth, gums, lips, and mouth muscles |
| 6 | Abducens | Muscle conditioning |
| 7 | Facial | Taste, facial expressions, tear and salivary glands |

| S. No | Cranial Nerves | Function |
|----------|-----------------------|--|
| 8 | Vestibulocochlear | Hearing and equilibrium |
| 9 | Glossopharyngeal | Pharynx, tonsils tongue and carotid arteries; stimulates salivary glands |
| 10 | Vagus | Speech, swallowing, heart muscle, smooth muscle and certain glands |
| 11 | Accessory | Muscles of the soft palate, pharynx, larynx and neck |
| 12 | Hypoglossal | Tongue movement |

Somatic Nervous System

➤ Responsible for receiving and processing sensory input from the skin, muscles, tendons, joints, eyes, tongue, nose and ears as well as excite the voluntary contraction of skeletal muscles.

Autonomic Nervous System

- ➤ Carries impulses from the central nervous system to glands, various smooth muscles, cardiac muscle and various membranes.
- > Stimulates organs, glands, and senses.

Spinal cord
